FUNCTIONS

37 A study of the annual population of the red-winged blackbird in Ft. Mill, South Carolina, shows the population, $B(t)$, can be represented by the function 
$B(t) = 750(1.16)^t$, where the $t$ represents the number of years since the study began. In terms of the monthly rate of growth, the population of red-winged blackbirds can be best approximated by the function 

1. $B(t) = 750(1.012)^{12t}$
2. $B(t) = 750(1.16)^{\frac{t}{12}}$

38 A student studying public policy created a model for the population of Detroit, where the population decreased 25% over a decade. He used the model

1. $P = 714(0.6500)^y$
2. $P = 714(0.8500)^y$
3. $P = 714(0.9716)^y$
4. $P = 714(0.9750)^y$

384 Tides are a periodic rise and fall of ocean water. On a typical day at a seaport, to predict the time of the next high tide, the most important value to have would be the

1 time between consecutive low tides

2 time when the tide height is 20 feet

3 average depth of water over a 24-hour period

4 difference between the water heights at low and high tide

She would like to move, and live in a location where the average annual temperature is 62°F. When examining the graphs of the average monthly temperatures for various locations, Melissa should focus on the

1 amplitude

2 horizontal shift

3 period

4 midline

386 The volume of air in a person’s lungs, as the person breathes in and out, can be modeled by a sine graph. When examining the graphs, should the scientist focus on the amplitude, period, or midline? Explain your choice.

387 On July 21, 2016, the water level in Puget Sound, WA reached a high of 10.1 ft at 6 a.m. and a low of -2 ft at 12:30 p.m. Across the country in Long Island, NY, Shinnecock Bay’s water level reached a high of 2.5 ft at 10:42 p.m. and a low of -0.1 ft at 5:31 a.m. The water levels of both locations are affected by the tides and can be modeled by sinusoidal functions. Determine the difference in amplitudes, in feet, for these two locations.

394 The ocean tides near Carter Beach follow a repeating pattern over time, with the amount of time between each low and high tide remaining relatively constant. On a certain day, low tide occurred at 8:30 a.m. and high tide occurred at 3:00 p.m. At high tide, the water level was 12 inches above the average local sea level; at low tide it was 12 inches below the average local sea level. Assume that high tide and low tide are the maximum and minimum water levels each day, respectively. Write a cosine function of the form $f(t) = A \cos(Bt)$, where $A$ and $B$ are real numbers, that models the water level, $f(t)$, in inches above or below the average Carter Beach sea level, as a function of the time measured in $t$ hours since 8:30 a.m. On the grid below, graph one cycle of this function.

People who fish in Carter Beach know that a certain species of fish is most plentiful when the water level is increasing. Explain whether you would recommend fishing for this species at 7:30 p.m. or 10:30 p.m. using evidence from the given context.

395 The resting blood pressure of an adult patient can be modeled by the function $P$ below, where $P(t)$ is the pressure in millimeters of mercury after time $t$ in seconds.

$$P(t) = 24 \cos(3\pi t) + 120$$

On the set of axes below, graph $y = P(t)$ over the domain $0 \leq t \leq 2$.

Determine the period of $P$. Explain what this value represents in the given context. Normal resting blood pressure for an adult is 120 over 80. This means that the blood pressure oscillates between a maximum of 120 and a minimum of 80. Adults with high blood pressure (above 140 over 90) and adults with low blood pressure (below 90 over 60) may be at risk for health disorders. Classify the given patient's blood pressure as low, normal, or high and explain your reasoning.

2. \( 4(x - 3)^2 + 4(y + 9)^2 = 121 \)
3. \( 4(x - 3)^2 + 4(y + 9)^2 = 166 \)
4. \( 4(x - 3)^2 + 4(y + 9)^2 = 436 \)

Stephen’s Beverage Company is considering whether to produce a new brand of cola. The company will launch the product if at least 25% of cola drinkers will buy the product. Fifty cola drinkers are randomly selected to take a blind taste-test of products \(A\), \(B\), and the new product. A parabola with a focus of \((0,4)\) and a directrix of \(y = 2\) is sketched as follows:

By inspection, it is determined that the vertex of the parabola is \((0,3)\). It is also evident that the distance, \(p\), between the vertex and the focus is 1. It is possible to use the formula \((x-h)^2 = 4p(y-k)\) to derive the equation of the parabola as follows:

\[
(x-0)^2 = 4(1)(y-3)
\]

\[
x^2 = 4y - 12
\]

\[
x^2 + 12 = 4y
\]

\[
x^2/4 + 3 = y
\]

or A point \((x,y)\) on the parabola must be the same distance from the focus as it is from the directrix. For any such point \((x,y)\), the distance to the focus is \(\sqrt{(x-0)^2 + (y-4)^2}\) and the distance to the directrix is \(y - 2\). Setting this equal leads to:

\[
x^2 + y^2 - 8y + 16 = y^2 - 4y + 4
\]

\[
x^2 + 16 = 4y + 4
\]

\[
x^2/4 + 3 = y
\]
32 ANS: 4
\[
\frac{5 + 9}{2} = 7, \text{ vertex: } (-2,7); \ p = 7 - 9 = -2, \ y = \frac{1}{4(-2)}(x + 2)^2 + 7 \\
\]

y - 7 = \frac{1}{-8}(x + 2)^2 \\

Since there is no remainder when the quartic is divided by $x - 2$, this binomial is a factor.

\[
\begin{array}{c|cccc}
2 & 1 & 0 & -4 & -8 \\
 & 2 & 4 & 0 & -8 \\
\hline
1 & 2 & 0 & -4 & 0 \\
\end{array}
\]

Since there is a remainder when the cubic is divided by $x + 4$, this binomial is not a factor.

\[
\begin{array}{c|cccc}
-4 & 1 & -11 & 16 & 84 \\
 & -4 & 60 & -304 & \\
\hline
1 & -15 & 76 & \\
\end{array}
\]

$f(4) = 2(4)^3 - 5(4)^2 - 11(4) - 4 = 128 - 80 - 44 - 4 = 0$ Any method that demonstrates 4 is a zero of $f(x)$ confirms that $x - 4$ is a factor, as suggested by the Remainder Theorem.

\[
\begin{array}{c|cccc}
-5 & 6 & 19 & -52 & 15 \\
 & -30 & 55 & 15 & \\
\hline
6 & -11 & 3 & 0 \\
\end{array}
\]

$6x^2 - 11x + 3 = 0$

$(2x - 3)(3x - 1) = 0$

\[x = \frac{3}{2} \cdot \frac{1}{3}, -5\]
Since there is a remainder, $x - 5$ is not a factor.

\[

\end{array}
\]

\[
\begin{array}{rrr}
105 & 23x & - 115

\]

Since there is a remainder when the cubic is divided by $x - 2$, this binomial is not a factor.

\[
\begin{array}{rrrr}

2 & & 4 & 6 \\
1 & -2 & 0 & -6

\]

$x = \pm 4, \frac{3}{2}$

Since $m(3) = 0$, there is no remainder when $m(x)$ is divided by $x - 3$, and so $x - 3$ is a factor.

\[ \csc \theta = \frac{1}{y}. \]
A reference triangle can be sketched using the coordinates \((-4,3)\) in the second quadrant to find the value of \(\sin \theta\).
If \( \cos \theta = \frac{7}{25} \), \( \sin \theta = \pm \frac{24}{25} \), and \( \tan \theta = \frac{\sin \theta}{\cos \theta} = \frac{\frac{24}{25}}{\frac{7}{25}} = -\frac{24}{7} \).

\[ \sqrt{1 - \left(\frac{3}{4}\right)^2} = -\sqrt{\frac{16}{16} - \frac{9}{16}} = -\sqrt{\frac{7}{16}} = -\frac{\sqrt{7}}{4} \]

Since \( \theta \) is in Quadrant II, \( \sin \theta = \sqrt{\frac{51}{2}} \) and \( \tan \theta = \frac{\sin \theta}{\cos \theta} = \frac{\sqrt{\frac{51}{2}}}{-0.7} \approx -1.02 \)

\[ \sin^2 \theta = 0.51 \]
\[ \sin \theta = \pm \sqrt{0.51} \]

\[ \tan \theta = \frac{\sin \theta}{\cos \theta} = \frac{-\frac{\sqrt{7}}{25}}{-\frac{24}{25}} \]

The amplitude, 12, can be interpreted from the situation, since the water level has a minimum of −12 and a maximum of 12. The value of \( A \) is −12 since at 8:30 it is low tide. The period of the function is 13 hours, and is expressed in the function through the parameter \( B \). By experimentation with technology or using the relation \( P = \frac{2\pi}{B} \) (where \( P \) is the period), it is determined that \( B = \frac{2\pi}{13} \).

\[
f(t) = -12 \cos \left( \frac{2\pi}{13} t \right)

In order to answer the question about when to fish, the student must interpret the function and determine which choice, 7:30 pm or 10:30 pm, is on an increasing interval. Since the function is increasing from \( t = 13 \) to \( t = 19.5 \) (which corresponds to 9:30 pm to 4:00 am), 10:30 is the appropriate choice.

The period of \( P \) is \( \frac{2}{3} \), which means the patient’s blood pressure reaches a high every \( \frac{2}{3} \) second and a low every \( \frac{2}{3} \) second. The patient’s blood pressure is high because 144 over 96 is greater than 120 over 80.

Yes. The margin of error from this simulation indicates that 95% of the observations fall within $\pm 0.12$ of the simulated proportion, 0.25. The margin of error can be estimated by multiplying the standard deviation, shown to be 0.06 in the dotplot, by 2, or applying the estimated standard error formula, \[
\sqrt{\frac{p(1-p)}{n}} \approx 0.03 \text{ or } \frac{1}{\sqrt{n}} \approx 0.03
\] and multiplying by 2. The interval $0.25 \pm 0.12$ includes plausible values for the true proportion of people who prefer Stephen’s new product. The company has evidence that the population proportion could be at least 25%. As seen in the dotplot, it can be expected to obtain a sample proportion of 0.18 (9 out of 50) or less several times, even when the population proportion is 0.25, due to sampling variability. Given this information, the results of the survey do not provide enough evidence to suggest that the true proportion is not at least 0.25, so the development of the product should continue at this time.

The mean difference between the students’ final grades in group 1 and group 2 is –3.64. This value indicates that students who met with a tutor had a mean final grade of 3.64 points less than students who used an on-line subscription. One can infer whether this difference is due to the differences in intervention or due to which students were assigned to each group by using a simulation to rerandomize the students’ final grades many (500) times. If the observed difference –3.64 is the result of the assignment of students to groups alone, then a difference of –3.64 or less should be observed fairly regularly in the simulation output. However, a difference of –3 or less occurs in only about 2% of the rerandomizations. Therefore, it is quite unlikely that the assignment to groups alone accounts for the difference; rather, it is likely that the difference between the interventions themselves accounts for the difference between the two groups’ mean final grades.
