Dear Sir

I have to acknowledge the receipt of your favor of May 14. in which you mention that you have finished the 6. first books of Euclid, plane trigonometry, surveying & algebra and ask whether I think a further pursuit of that branch of science would be useful to you. There are some propositions in the latter books of Euclid, & some of Archimedes, which are useful, & I have no doubt you have been made acquainted with them. Trigonometry, so far as this, is most valuable to every man, there is scarcely a day in which he will not resort to it for some of the purposes of common life. The science of calculation also is indispensable as far as the extraction of the square & cube roots; Algebra as far as the quadratic equation & the use of logarithms are often of value in ordinary cases; but all beyond these is but a luxury: a delicious luxury indeed; but not to be indulged in by one who is to have a profession to follow for his subsistence. In this light I view the conic sections, curves of the higher orders, perhaps even spherical trigonometry, Algebraical operations beyond the 2d dimension, and fluxions.

19 ANS: 3
The other situations are quantitative.

The top part of the page starts with the identification of the vertex of a quadratic given graph. The vertex is calculated using the formulae for finding the vertex of a quadratic function. The slope of two lines is determined, and the slope of both lines is found to be -4. The problem involving the division of powers is solved, and the result is simplified to \(2^1\). Another problem involves simplifying expressions with powers, and the result is \(\frac{x + 3}{3}\). The last problem involves trigonometry, where the sine of an angle is calculated as \(\frac{8}{12}\) and the angle is approximated to be 42 degrees. Finally, a set theory problem is solved, identifying the set of integers greater than -2 and less than 6, the subset of positive factors of 5, and the complement of that subset.
