The marked 60º angle and the angle above it are on the same straight line and supplementary. This unmarked supplementary angle is 120º. Because the unmarked 120º angle and the marked 120º angle are alternate exterior angles and congruent, \( d \parallel e \).
If $\angle A$ is at minimum (50°) and $\angle B$ is at minimum (90°), $\angle C$ is at maximum of 40° ($180° - (50° + 90°)$). If $\angle A$ is at maximum (60°) and $\angle B$ is at maximum (100°), $\angle C$ is at minimum of 20° ($180° - (60° + 100°)$).

Quadrilateral $ABCD$, $AD \cong BC$ and $\angle DAE \cong \angle BCE$ are given. $AD \parallel BC$ because if two lines are cut by a transversal so that a pair of alternate interior angles are congruent, the lines are parallel. $ABCD$ is a parallelogram because if one pair of opposite sides of a quadrilateral are both congruent and parallel, the quadrilateral is a parallelogram. $AE \cong CE$ because the diagonals of a parallelogram bisect each other. $\angle FEA \cong \angle GEC$ as vertical angles. $\triangle AEF \cong \triangle CEG$ by ASA.

Because \( \overline{AB} \parallel \overline{DC}, \overline{AD} \cong \overline{BC} \) since parallel chords intersect congruent arcs. \( \angle BDC \cong \angle ACD \) because inscribed angles that intercept congruent arcs are congruent. \( \overline{AD} \cong \overline{BC} \) since congruent chords intersect congruent arcs. \( \angle DAC \cong \angle DBC \) because inscribed angles that intercept the same arc are congruent. Rectangle $ABCD$ with points $E$ and $F$ on side $AB$, segments $CE$ and $DF$ intersect at $G$, and $\angle ADG \cong \angle BCE$ are given. $AD \cong BC$ because opposite sides of a rectangle are congruent. $\angle A$ and $\angle B$ are right angles and congruent because all angles of a rectangle are right and congruent. $\triangle ADF \cong \triangle BCE$ by ASA. $AF \cong BE$ per CPCTC. $EF \cong FE$ under the Reflexive Property. $AF - EF \cong BE - FE$ using the Subtraction Property of Segments. $AE \cong BF$ because of the Definition of Segments.

601 ANS:
$OA \cong OB$ because all radii are equal. $OP \cong OP$ because of the reflexive property. $OA \perp PA$ and $OB \perp PB$ because tangents to a circle are perpendicular to a radius at a point on a circle. $\angle PAO \cong \angle PBO$ because all right angles are congruent. $\triangle AOP \cong \triangle BOP$ because of HL. $\angle AOP \cong \angle BOP$ because of CPCTC.

$AC \cong EC$ and $DC \cong BC$ because of the definition of midpoint. $\angle ACB \cong \angle ECD$ because of vertical angles. $\triangle ABC \cong \triangle EDC$ because of SAS. $\angle CDE \cong \angle CBA$ because of CPCTC. $BD$ is a transversal intersecting $AB$ and $ED$. Therefore $AB \parallel DE$ because $\angle CDE$ and $\angle CBA$ are congruent alternate interior angles.

To prove that $ADEF$ is a parallelogram, show that both pairs of opposite sides of the parallelogram are parallel by showing the opposite sides have the same slope: $m_{AD} = \frac{3-2}{-2-6} = \frac{5}{4}$, $AF \parallel DE$ because all horizontal lines have the same slope. $ADEF$ is not a rhombus because not all sides are congruent. $AD = \sqrt{5^2 + 4^2} = \sqrt{41}$, $AF = 6$

\[ Q\left(\frac{-7 + 1}{2}, \frac{4 + -8}{2}\right) = Q(-3, -2) \]

Since both opposite sides have equal slopes and are parallel, \(MNPQ\) is a parallelogram.

\[ \overline{MN} = \sqrt{(-5 - 0)^2 + (5 - 3)^2} = \sqrt{29} \]

\[ \overline{NA} = \sqrt{(0 - 2)^2 + (3 - 4)^2} = \sqrt{53} \]

\[ m_{NA} = \frac{3 - -4}{0 - 2} = \frac{7}{-2} \]

\[ m_{OM} = \frac{-2 - 5}{-3 - -5} = \frac{-7}{2} \]

\[ \overline{MN} = \sqrt{29} \]

\[ \overline{NA} = \sqrt{53} \]

\[ \overline{MN} \] is not congruent to \( \overline{NP} \), so \( MNPQ \) is not a rhombus since not all sides are congruent.
