1 Howard collected fish eggs from a pond behind his house so he could determine whether sunlight had an effect on how many of the eggs hatched. After he collected the eggs, he divided them into two tanks. He put both tanks outside near the pond, and he covered one of the tanks with a box to block out all sunlight. State whether Howard's investigation was an example of a controlled experiment, an observation, or a survey. Justify your response.

2 Which task is not a component of an observational study?
   1. The researcher decides who will make up the sample.
   2. The researcher analyzes the data received from the sample.
   3. The researcher gathers data from the sample, using surveys or taking measurements.
   4. The researcher divides the sample into two groups, with one group acting as a control group.

3 A doctor wants to test the effectiveness of a new drug on her patients. She separates her sample of patients into two groups and administers the drug to only one of these groups. She then compares the results. Which type of study best describes this situation?

   3. every third student to enter the gym for the basketball game
   4. every third student arriving at school in the morning
