Since the square is inscribed, each vertex of the square is on the circle and the diagonals of the square are diameters of the circle. Therefore, each angle of the square is an inscribed angle in the circle that intercepts the circle at the endpoints of the diameters. Each angle of the square, which is an inscribed angle, measures 90 degrees. Therefore, the measure of the arc intercepted by two adjacent sides of the square is 180 degrees because it is twice the measure of its inscribed angle.
Right triangle because $\angle CBF$ is inscribed in a semi-circle.

The slope of the dilated line, \( m \), will remain the same as the slope of line \( h \), 2. All points on line \( h \), such as \((0,1)\), the \( y \)-intercept, are dilated by a scale factor of 4; therefore, the \( y \)-intercept of the dilated line is \((0,4)\) because the center of dilation is the origin, resulting in the dilated line represented by the equation \( y = -2x + 4 \).

The line \( y = 2x - 4 \) does not pass through the center of dilation, so the dilated line will be distinct from \( y = 2x - 4 \). Since a dilation preserves parallelism, the line \( y = 2x - 4 \) and its image will be parallel, with slopes of 2. To obtain the \( y \)-intercept of the dilated line, the scale factor of the dilation, \( \frac{3}{2} \), can be applied to the \( y \)-intercept, \((0,-4)\). Therefore, \( \left\{ 0 \cdot \frac{3}{2}, -4 \cdot \frac{3}{2} \right\} \rightarrow (0,-6) \). So the equation of the dilated line is \( y = 2x - 6 \).

Triangle \(X'Y'Z'\) is the image of \(\triangle XYZ\) after a rotation about point \(Z\) such that \(\overline{ZX}'\) coincides with \(\overline{ZU}\). Since rotations preserve angle measure, \(\overline{ZY}\) coincides with \(\overline{ZV}\), and corresponding angles \(X'\) and \(Y\), after the rotation, remain congruent, so \(X'Y'\parallel UV\). Then, dilate \(\triangle X'Y'Z'\) by a scale factor of \(\frac{ZU}{ZX}\) with its center at point \(Z\). Since dilations preserve parallelism, \(\overline{XY}\) maps onto \(\overline{UV}\). Therefore, \(\triangle XYZ \sim \triangle UVZ\).

\[ M = 180 - (47 + 57) = 76 \] Rotations do not change angle measurements.

The measures of the angles of a triangle remain the same after all rotations because rotations are rigid motions which preserve angle measure.
