26 The diagram below shows parallelogram $LMNO$ with diagonal $\overline{LN}$, $m\angle M = 118^\circ$, and $m\angle LNO = 22^\circ$.

Explain why $m\angle NLO$ is 40 degrees.

Opposite angles in a parallelogram are congruent, so $m\angle LNO = 118^\circ$. The interior angles of a triangle equal $180^\circ$.

$180^\circ - (118^\circ + 22^\circ) = 40^\circ$

32 In the diagram below, \(EF\) intersects \(\overline{AB}\) and \(\overline{CD}\) at \(G\) and \(H\), respectively, and \(\overline{GI}\) is drawn such that \(GH \equiv IH\).

If \(m\angle EGB = 50^\circ\) and \(m\angle DIG = 115^\circ\), explain why \(\overline{AB} \parallel \overline{CD}\).

Since linear angles are supplementary, \(m\angle GIH = 65\). Since \(GH \equiv IH\), \(m\angle GCH = 65\).

\(m\angle GCH = 50 (180 - (65+65))\). Since \(\angle EGB \equiv \angle GCH\), the corresponding angles formed by the transversal \(\overline{EF}\) lines are equal \(\Rightarrow \overline{AB} \parallel \overline{CD}\).

In the diagram below, the line of sight from the park ranger station, \( P \), to the lifeguard chair, \( L \), on the beach of a lake is perpendicular to the path joining the campground, \( C \), and the first aid station, \( F \). The campground is 0.25 mile from the lifeguard chair. The straight paths from both the campground and first aid station to the park ranger station are perpendicular.

If the path from the park ranger station to the campground is 0.55 mile, determine and state, to the nearest hundredth of a mile, the distance between the park ranger station and the lifeguard chair.

Question 36 is continued on the next page.
Question 36 continued

Prove that your quadrilateral RSTP is a rectangle.
[The use of the set of axes below is optional.]

Since the slopes of all four adjacent sides ($\overline{RS}$, $\overline{ST}$, $\overline{TP}$, $\overline{PR}$) are opposite reciprocals, they are perpendicular to form right angles. Quadrilateral RSTP is a rectangle because it has four right angles.
